

Problem Definition :Initiate the semester-long StudentHub portal by identifying the problem

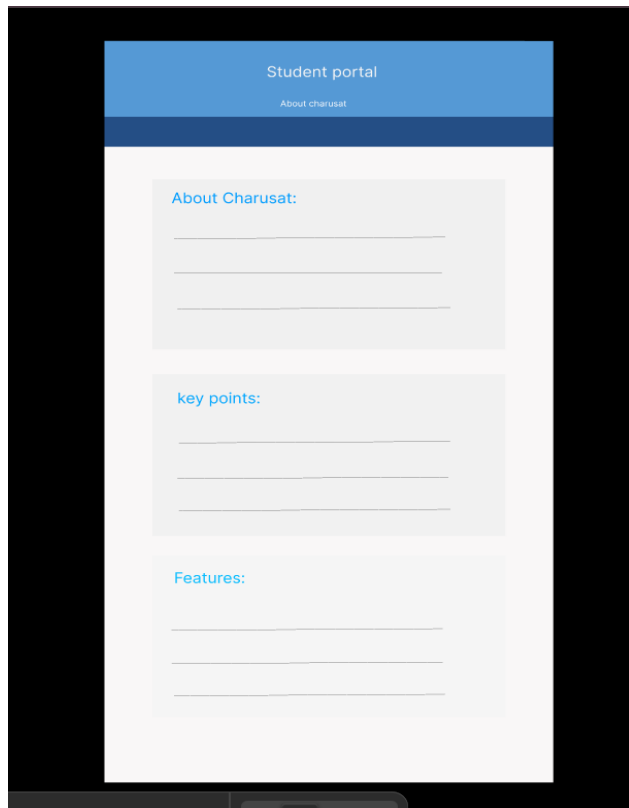

scope, user roles, key modules, navigation flow, and minimum 10 pages.

Create a sitemap, low-fidelity wireframe, project folder structure,

README file, and GitHub repository.

GITHUB:

A mockup of a student portal interface. It features a blue header bar with the text "Student portal" and a smaller link "About charusat". Below the header, there are three light gray content boxes. The first box is titled "About Charusat:" and contains three horizontal lines for text. The second box is titled "key points:" and contains three horizontal lines. The third box is titled "Features:" and contains three horizontal lines.

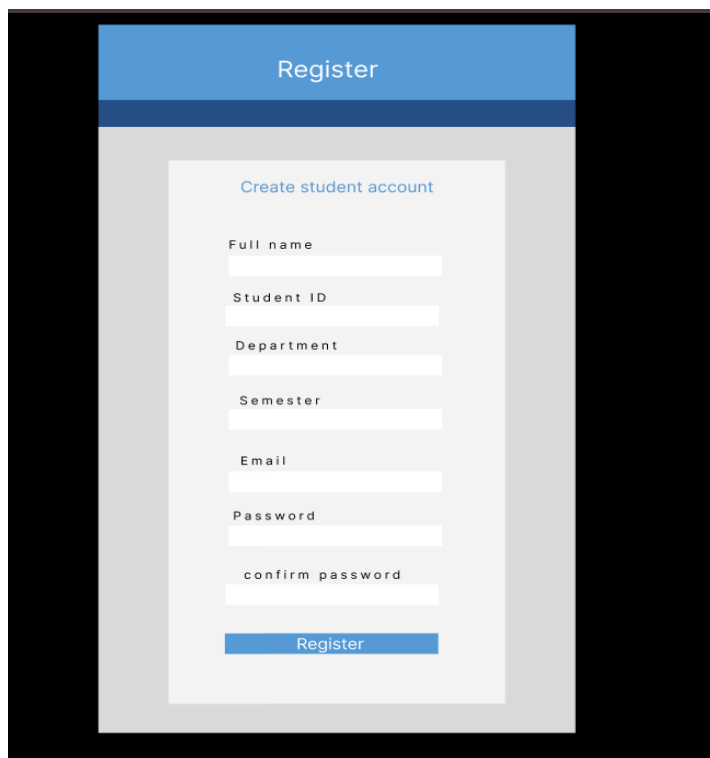

Student portal

About charusat

About Charusat:

key points:

Features:

A mockup of a registration form. It has a blue header bar with the text "Register". Below the header, there is a light gray box containing the text "Create student account". Inside this box, there are seven input fields with labels: "Full name", "Student ID", "Department", "Semester", "Email", "Password", and "confirm password". At the bottom of the box is a blue button labeled "Register".

Problems I faced:

In beginning I did not know about wireframe and sitemaps because I never made it before. I was also confused about how different pages should be connected in website .After looking at

some website still I faced difficulty to decide website pages included student portal. So,It took me some time to make wireframes and sitemap of website.

I had little knowledge of git and github,so creating repository its little difficult for me. It took time to understand how project planning should be completed before starting coding.

Learnings:

In this practical,I learned how to understand the project requirements before starting website development ,how to define the project scope,identify the user role,and divide the student hub portal in different modules.I learned how to create sitemap,wireframes also learned the basics of Git and GitHub for version control and how to maintain commits after each practical.

I learned planning a web application before implementation makes the development process easier .
